

1 March 1979

## MILITARY SPECIFICATION

SEMICONDUCTOR DEVICE, TRANSISTOR, SILICON  
TYPE 2N3906

This specification is approved for use by the Electronics Command, Department of the Army, and is available for use by all Departments and Agencies of the Department of Defense.

## 1. SCOPE

1.1 Scope. This specification covers the detail requirements for PNP, Silicon, Plastic encapsulated transistor, designed for general switching and amplifier applications.

1.2 Outline and Dimensions. See Figure 1 herein.

1.3 Maximum Ratings. (At  $T_A = +25^\circ\text{C}$ , unless otherwise specified).

$P_T$	$\theta_{J-C}$	$V_{CB}$	$V_{CE}$	$V_{EB}$	$I_C$	$T_{op}$ and $T_{stg}$
·MW	MW/ $^\circ\text{C}$	Vdc	Vdc	Vdc	mAdc	$^\circ\text{C}$
310	2.73	40	40	5	200	-55 to +150

1.4 Primary Electrical Characteristics. (At  $T_A = +25^\circ\text{C}$ ).

$h_{FE}$			$C_{obo}$	/hfe/	NF	Switching Times		
$I_C = .1\text{mA dc}$ $V_{CE} -1\text{V}$			$I_C = 10\text{mA}$ $V_{CE} -1\text{V}$	$I_C = 50\text{mA}$ $V_{CE} -1\text{V}$	$F = 1\text{MHz}$ $V_{CB} = 5\text{V}$ $I_E = 0$ pf	$f = 1.0\text{ KHz}$ $I_C = 1\text{ MA}$ $V_{CE} = 10\text{Vdc}$	$f = 10-15.7\text{ KHz}$ $I_C = 100\mu\text{A}$ $V_{CE} = 5\text{V}$ $R_s = 1\text{kohms}$	$V_{CC} = 3.0\text{Vdc}$ $I_C = 10\text{ mAdc}$ $I_E = 1\text{ mAdc}$ $T_{on}\text{ ns}$ $T_{off}\text{ ns}$
MIN	60	100		100				
MAX		300	4.5	400	4	70	300	

Beneficial comments (recommendations, additions, deletions) and any pertinent data which may be of use in improving this document should be addressed to: Commander, US Army Electronics Command, ATTN: DRSEL-RD-TS-S, Fort Monmouth, NJ 07703, by using the self-addressed Standardization Document Improvement Proposal (DD Form 1426) appearing at the end of this document or by letter.

## 2 APPLICABLE DOCUMENTS

2.1 The following documents, of the issue in effect on date of invitation for bids or request for proposal, form a part of the specification to the extent specified herein.

### SPECIFICATION

#### MILITARY

MIL-S-19500 - Semiconductor Devices, General Specification for

### STANDARDS

MIL-STD-202 - Test Methods for Electronic and Electrical Component Parts

MIL-STD-750 - Test Methods for Semiconductor Devices

(Copies of specifications, standards, drawings, and publications required by contractors in connection with specific procurement functions should be obtained from the procuring agency or as directed by the contracting officer.)

## 3 REQUIREMENTS

3.1 General. Requirements shall be in accordance with MIL-S-19500, and as specified herein.

3.2 Abbreviations, symbols, and definitions. The abbreviations, symbols, and definitions used herein are defined in MIL-S-19500.

3.3 Design, construction, and physical dimensions. Transistors shall be of the design, construction, and physical dimensions shown on Figure 1. The devices covered by this specification shall be encapsulated in a plastic material which polymerizes to a rigid condition by virtue of a chemical cross-linking mechanism. Information covering the material(s) used shall be included with the qualification design data to the qualifying activity. Paragraph 3.6.1 of MIL-S-19500 does not apply to the devices covered by this specification.

3.4 Performance characteristics. Performance characteristics shall be as specified in Table I, II and III.

3.5 Marking. The following marking shall be applied:

- a. Type designation and code identification
- b. Manufacturer's identification and date code

## 4 QUALITY ASSURANCE PROVISIONS

4.1 The transistor covered by this specification (2N3906) is not intended to be certified at a higher quality level than JAN.

4.2 Qualification and acceptance inspection shall be in accordance with MIL-S-19500 quality assurance provisions, and as otherwise specified herein. Groups A, B & C inspection shall consist of the examinations and tests specified in Table I, II & III respectively. The LTPD specified for a Subgroup in Tables I, II & III shall apply for all of the tests combined, in the subgroup. Sample units subjected to Group B, Subgroup 4 and 5 tests, shall not be delivered on the contract or order. Sample units that have been subjected to and have passed Group B, Subgroups 1, 2, 3 and 6 Tests. (These tests to be considered non destructive), may be delivered on the contract or order provided that, after Group B inspection is terminated, those sample units are subjected to and pass Group A inspection. Defective units from any sample group that may have passed group inspection shall not be delivered on the contract or order until the defect(s) has been remedied to the satisfaction of the contractor.

#### 4.3 Particular Examination and Test Requirements:

4.3.1 All electrical test measurements shall be made at room ambient, free-air, temperature of  $+25^{\circ} \pm 3^{\circ}\text{C}$  unless otherwise specified herein.

4.3.2 All applicable end-point test measurements shall be made, where-ever possible, within four (4) hours, after the particular sample units have been subjected to the required physical-mechanical or environmental test(s). This "interval" requirement shall not be applicable to measurements specified to be made during (subjection of sample units to) a physical-mechanical or environmental test and shall not be applicable where otherwise specified for life test(s).

4.3.3 Except for intentionally deforming, mutilating, or dismembering mechanical-stress tests to which samples are subjected, there shall be no evidence of mechanical damage to any sample unit after any of the Group A, B or C tests.

4.3.4 The markings shall be legible after salt atmosphere corrosion test. There shall be no evidence (when examined with no magnification) of flaking or pitting of the finish or corrosion that will interfere with the mechanical and electrical applications of the device.

4.3.5 End-point test measurements bias moisture resistance test shall be initiated no sooner than twelve (12) hours and completed no later than forty-eight (48) hours after removal from moisture test. Prior to measurement devices must be stored in an air-conditioned room. At no greater than  $25^{\circ}\text{C}$ .

4.3.6 For the high temperature bias life test, after 1000 hours of test and prior to end-point test measurements, the devices will be allowed to cool to  $25^{\circ}\text{C}$  with the C-B voltages applied during the entire time. Within 48 hours after reaching  $25^{\circ}\text{C}$ , voltages will be removed and end-point measurements made.

4.3.7 Group A inspection shall consist of the examination and test specified in Table I. Group B inspection shall consist of the examination and test in Table II. Group C shall consist of the examination and test in Table III.

4.3.8 For the steam pressure test, devices will be submitted to a steam pressure chamber at 15 psig  $\pm$  2 psig for 96 hours. Devices will be suspended above the water (deionized) which will be of sufficient quantity to permit 96 hours of continuous testing. Remove devices from chamber. Proceed as Para. 4.3.5.

4.3.9 External Visual: Sample shall be inspected up to 6x magnification with direct and oblique light for the following defects:

4.3.9.1 Holes or voids in the encapsulant greater than 0.025 inch in any direction.

4.3.9.2 Cracks in the encapsulant which touch any lead.

4.3.9.3 More than one sharp bend along any lead.

4.3.9.4 Flash on the body of the package greater than 0.025 inch or any protrusion which causes the device to be larger than the outline drawing dimensions.

4.3.9.5 Flash down the leads more than 0.05 inch.

4.3.9.6 Flashing of lead metallization.

4.3.9.7 Any stain, ink or encapsulant spots on the leads larger than two lead diameters.

TABLE I - Group A Inspection
